Note Use the _Organize_ tool to move or copy images to a new location. Adobe Photoshop allows you to organize your images in a library as a folder or in a series of separate folders (as shown in Figure 4-5). You can organize your images into folders in various ways depending on your needs. Your images will then appear in a new window called a Library. You may or may not view all the images at once. To

organize images, choose Edit→Organize or press Ctrl+O (Windows) or +O (Mac OS). The Organize dialog box opens (Figure 4-6).

Elements is a photo editor, but it also offers simple editing features to help you make changes to color and text. It can edit color, contrast, brightness, text, and many other features. It is great for people who are just starting out or are not experienced with digital photography. This guide will cover some of the features, tools and best practices for using Photoshop

Elements. It is not a guide on how to use Photoshop Elements; that has been covered in many other Photoshop Elements guides. While some of the following terminology may be intimidating at first, you'll find that it becomes second nature as you use it to edit your photos. All Photoshop Elements users start by editing an image using the basic tools located in the Edit and Convert Toolbar. Using these tools is the fastest way to learn to use the program. Use the Basic Tools to Edit Images When your image opens in Photoshop Elements, you will find a toolbar with various tools, including a toolbar with the Basic tools, as shown in

the following screenshot: The basic tools are the tools that you will use most often. Use them to edit your photos as quickly and easily as possible. The Basic tools are the most important. Basic Edit Tools The basic tools are shown in the following screenshot: That screenshot shows the basic tools shown in the Edit and Convert toolbar. There are also a few more that appear when you right-click in the image canvas, and those are covered later. Step 1: Select an Area with a Selection Brush The first basic tool is the Selection Brush. The selection brush is the fastest and easiest way to edit the image on your computer. Select a portion of an image

by using the brush and then paint over the areas that you want to keep or completely change. Use the Selection Brush When Editing With Photoshop Elements To select an area with a Selection Brush, select the brush icon from the toolbar on the right. Step 2: Select a Color from a Swatch or Color Panel You can also change colors in the image using a color panel or swatch. A swatch contains a variety of colors that you can change, and the location of a swatch appears in the color panel. A color panel shows a variety of colors that you can change. To access a color panel or swatch, select the square with the color that you want to 05a79cecff

Q: How do you add members to an existing.env file? I'd like to add some variables to an existing.env file. So for example, I have a.env file that looks like this: ROOT=./../ BASE=../$ROOT And I've added an environment variable to it like this: BASE=../$ROOT/ However, it seems to ignore this environment variable. Can anyone help please? A: Plese note that.env file can be created when you use Flyway command. So, if you use it from time to time, you may forget adding new variables, and you will only be able to see ones, which was created during the

last command invocation. So, to be able to add new variables in existing.env file, you can only add them to the flyway.properties file which is generated when you run your first flyway command. If you want to add new variable to the existing.env file, you need to generate flyway properties from the last existing one, using command like this: mvn flyway:generate-resource In this case, the flyway.properties file will be created in the root folder of your project, with variables from the last.env file. So, you only need to add new variable to the flyway.properties file Q: How to construct simple SQL statement

to copy all records in Table1 to Table2 which are not present in Table3? I'm very new to SQL and please bear with me if the solution to this question sounds so simple. I'm working on migrating content between two SQL-Server databases. Say I have two tables that I want to copy data between: Table1 ID Name Item1 Item2 Item3 Item4 Item5 1 Bike 23 34 36 45 54 2 Car 3 56 67
